Not illustrated. 1917 Excerpt: .in connection with the economic use of electricity in all electrolytic processes. The validity of Faraday s law has been tested by numerous experiments carried out with the utmost care. It has been found to hold, not only for all solvents, but also for fused electrolytes as well. The Electrochemical Constant. Since the same quantity of electricity--positive or negative--is always carried by a univalent ion, this quantity may be considered as the unit of ionic charge. A bivalent ion will thus carry two unit charges and an n-valent ion will carry n unit charges. In other words, we may think of valence as representing the number of unit charges of electricity which are associated with the respective ions. According to this view Faraday s law may be stated as follows: Chemically equivalent masses of matter possess the same capacity for electricity. The precise measurement of this fundamental quantity of electricity is obviously a matter of great scientific and practical importance. It can be determined by passing a known quantity of electricity thru a solution of an electrolyte and weighing the metal deposited at the cathode surface or measuring the volume of gas set free. The most satisfactory results have been obtained when a neutral solution of silver nitrate is used, containing about 15 parts of the salt to 100 parts of water, and with a current density of about 0.01 ampere per square centimeter. The silver is deposited on a platinum dish the inner surface of...
